

Rosalba Fittipaldi is, since October 2012, researcher of the Institute for Superconductors and Innovative Materials and Devices (SPIN) of the National Research Council (CNR). Her main research interest is in studying the mechanisms driven by the electronic correlations, dimensionality and relativistic effects in transition metal oxides (TMO). Systems under current studies include ruthenates oxides, non-centrosymmetric superconductors, metal and oxides nanosystems, and topological insulators. She performed research activities at large scale facilities (DIAMOND, ILL, ESRF, ELETTRA) and has coauthored more than 200 papers published on peer-reviewed journals. She has been chair of three international workshops organized within the European COST Action MP1308 TO-BE “Towards Oxide-Based Electronics” and of the sixth edition of the Directionally Solidified Eutectics Conference.
